HELICOIDAL FAN

## ELECTRONIC MOTOR

Since 1950 Sabiana has been manufacturing hot water, high temperature hot water and steam unit heaters for heating industrial and commercial environments, with proprietary manufacturing technology and a wide range of solutions.

In all the European countries the most common heating system for industrial environments uses hot water unit heaters connected to a central heating system.

The excellent ratio of indoor comfort to system cost, continual improvements in efficiency of hot water production, using both condensing boilers and heat pumps, the use of specific solutions such as flow optimisers on the units, as well as flexible installation and easy adaptation to new production plant layouts even after installation, mean that still today thousands of designers and businesses propose and adopt this heating solution.

A further development is proposed in this catalogue: every model is provided with an electronic motor controlled by a built-in inverter. The ECM motors allow electric energy saving if compared to traditional asynchronous motors and they enable to continuously adjust the air flow and control the ambient temperature with precision, with further benefits in terms of very low noise levels.

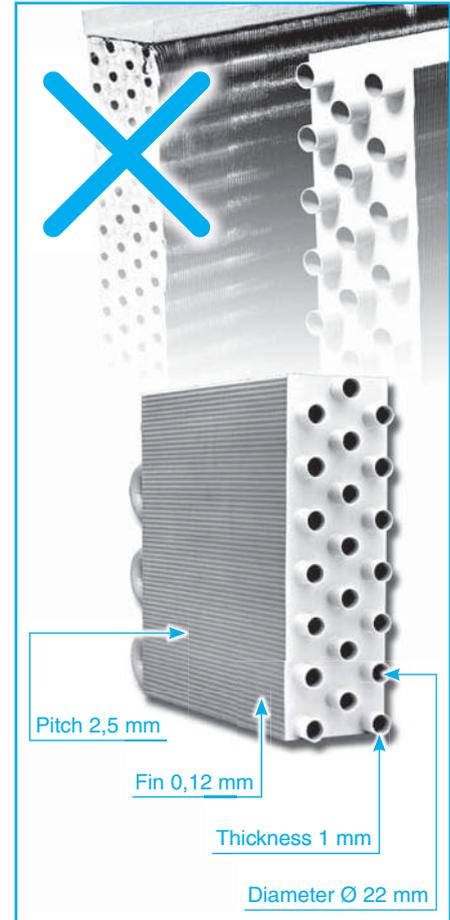

All range is compliant with the new ERP 2013 Regulation (EU) No. 327/2011 which requires very low electric consumption ratings in relation to performances provided.

Sabiana is the leading manufacturer of unit heaters, and competes worldwide providing the latest technology in environmental comfort.

### Coil

- The coil of Sabiana **Atlas ECM** unit heaters with steel tubes  $\varnothing 22$  mm and aluminium fins has the following advantages compared with the copper-aluminium small diameter tube coils: the material used for the steel tube, which is very thick (1 mm instead of 0,3 - 0,4 mm), makes the Sabiana coil extremely sturdy and long lasting.
- The tube's large diameter reduces the water pressure drop: this means that reduced power pumps are installed and a very rapid heating capacity is provided.
- The Sabiana coil for unit heaters uses a reduced number of tubes to give the same output: this gives a low resistance to the air flow and consequently an optimum leaving air temperature and a very long throw.
- With a greater spacing between the fins as well as their thickness this facilitates cleaning and maintenance operations, which is essential to keep the unit heater efficient.  
The steel tube coil is the ideal choice for installations where all tubes and equipment are made of steel because it avoids physical and chemical unbalance due to the interaction of different metals.
- The special paint coating makes the coil long lasting and increases the thermal output.
- The Sabiana coil can be used with hot water.  
Each coil is submitted to two tests at 30 bars.
- However, in order to meet any design or installation needs Sabiana can offer a complete set of unit heaters with copper tubes and aluminium fins. This coil has the same features (tube diameter, fin pitch, etc.) of the steel coil but it is built with copper tube 0,7 mm thick of higher quality and with a higher mass than the coils normally used for unit heaters.
- The wide range of products consists of **6 different sizes** with **1, 2 or 3 rows** each.

### Electronic motor

Single phase permanent magnet brushless electronic motor, IP 54 protection and class B insulation.  
The inverter board that controls the motor operation is powered by single-phase and it generates a frequency modulated wave form power supply.  
The electric power supply required for the machine is therefore single-phase with voltage of **200 - 240 V** and frequency of **50 - 60 Hz**.

### Helicoidal fan

The fan is made with statically and dynamically balanced plastic or aluminium blades.  
Its rational high-capacity profile provides the maximum air volume with the minimum energy consumption.  
The air flow is uniformly distributed through the whole coil and consequently the unit is very quiet.

### Electric fan support

The finger proof guard in galvanized steel also acts as the main support and fixing frame.  
This frame is mounted onto the main casing via residually anti-vibration rubber mountings.

**Casing**

The main casing is manufactured from galvanized pre-painted steel finished in a light grey colour (RAL 9002) and is assembled from three component parts. The steel is 1 mm thick and pre-painted before manufacture to prevent the material being subjected to oxidation. The use of steel with 200 gr/m<sup>2</sup>. (according to Euronorm 142-79) and pre-painting guarantees a perfect finish and superior protection against corrosion. The component parts are held together by anti vibration screws that allow easy and fast access and maintenance of the unit and coil.

**Louvres**

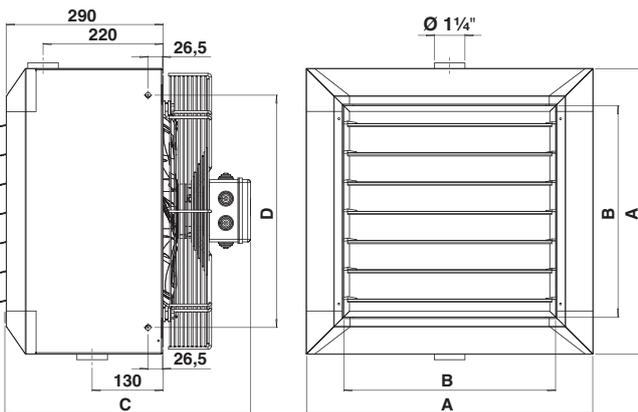

Louvres are made from a profiled pre-painted steel sheet with a design that allows excellent direction of air flow. The adjustable louvres are held in place by spring loaded pivots which allow the rotation of every single louvre in the desired position without vibrations. Fourway distribution is achieved by the addition of a second set of louvres to the front of the unit, generally for downward application.

LEGEND:

WT = Water temperature      Ph = Emission      Qw = Water flow  
 LAT = Leaving air temperature      Vdc = Inverter Power      Qv = Air flow

The following tables indicate the pressure drop in m/wg for each **Atlas ECM** model for a mean water temperature of 80°C.

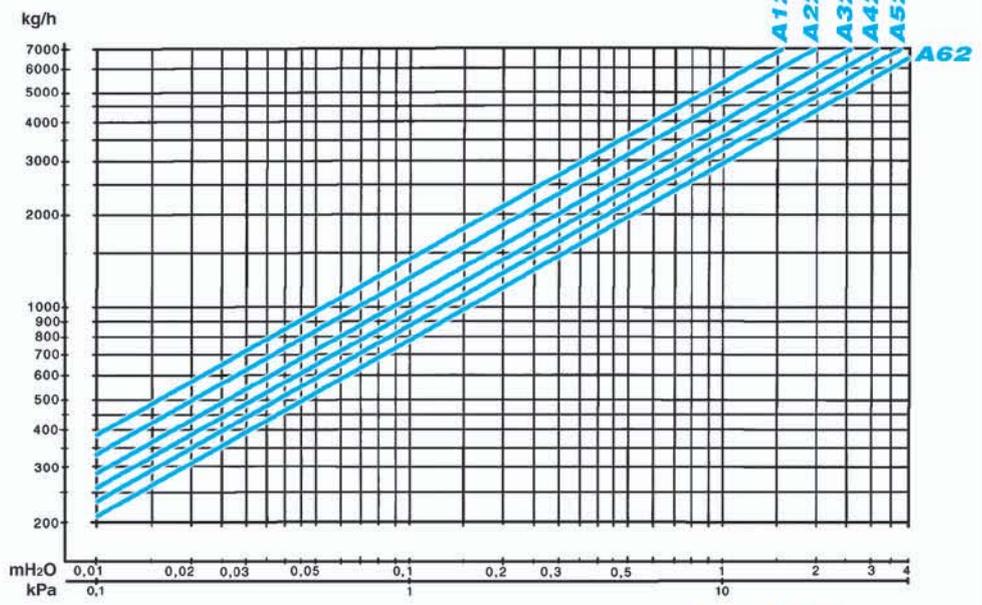

**CORRECTION FACTORS FOR DIFFERENT TEMPERATURES**

°C	K
50	1.15
60	1.10
70	1.05
90	0.95
100	0.89
110	0.83
120	0.78
130	0.72
140	0.67
150	0.61

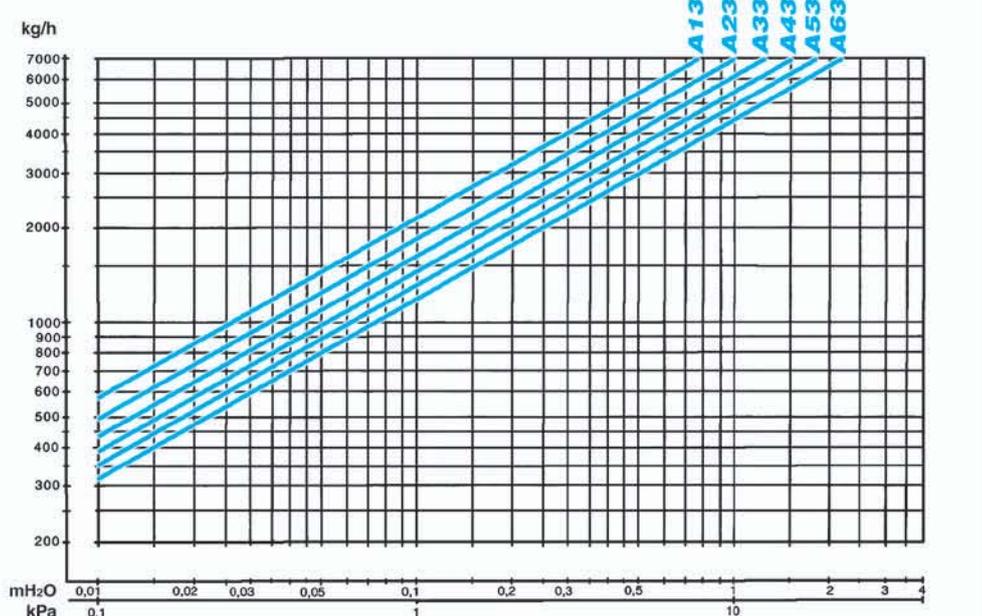

**1 row**

**2 rows**

**3 rows**

**Construction features**

The **Jetstream** induction flow optimizer allows the reduction of the mean leaving air temperature from the Atlas ECM Sabiana unit heaters and to increase the throw of the equipment with considerable advantages both in terms of energy saving and environment comfort. The **Jetstream** induction flow optimizers increase the air speed thanks to the special shape of its deflecting louvers which allow the creation of various streams of hot air at the unit heater outlet. The depression created between the layers induces a lateral aspiration of ambient air that mixes with the air heated by the unit, thus reducing the leaving air temperature and increasing the throw. The leaving air temperature from the units has a decisive influence on hot air stratification and consequently on energy saving: for each degree of decrease in ambient temperature there is a 1.5% decrease in energy consumption.

The use of **Jetstream** induction flow optimizer has the following advantages:

**a) Energy saving:**

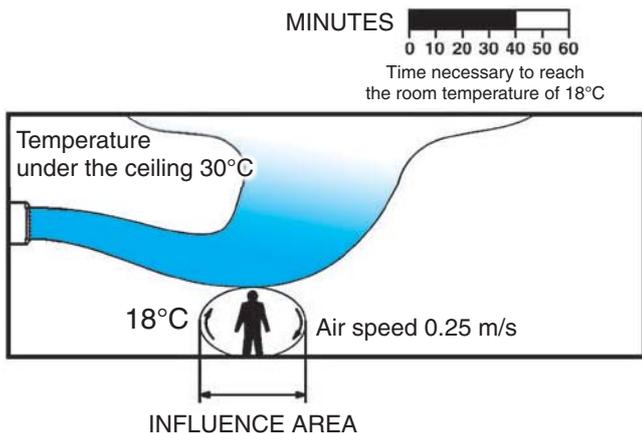

- reduced hot air stratification within the building;
- reduced operating time of the units with the same ambient temperature.

Energy saving varies between a minimum of 5% and a maximum of 15%, with maximum payback in two seasons.

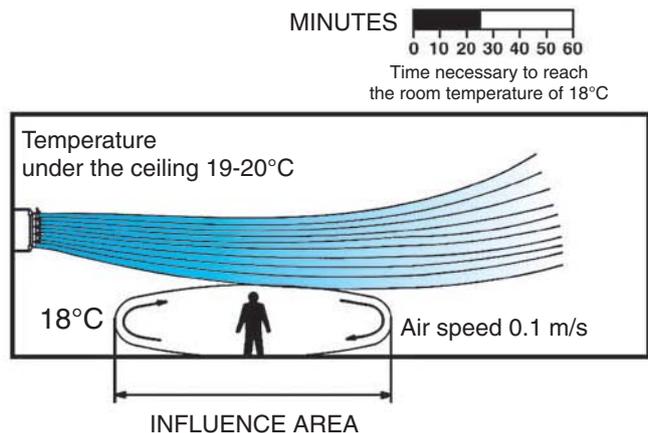

**b) Environmental comfort advantages:**

- increased floor temperature uniformity with greater comfort area;
- possibility to install smaller and quieter units, due to the increase of the throw.

**Air flow produced by a unit heater WITHOUT induction flow optimizer**

**Air flow produced by a unit heater WITH induction flow optimizer**

**Available versions**

Four versions are available:

- **Manual** for wall installation
- **Manual** for ceiling installation
- **Motorized** for wall installation
- **Motorized** for ceiling installation

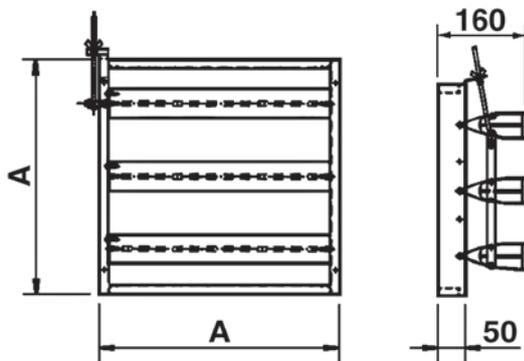

The **manually controlled** version calls for manual orientation of the louvres and for them to be locked using a special threaded rod.

The **motorized** version is supplied with single phase motor that can be controlled by the remote switch.

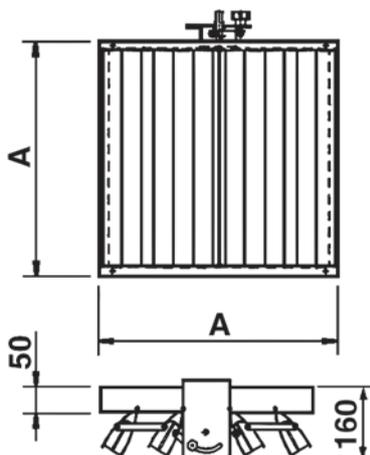

**Dimensions and Weight**

**O (HORIZONTAL DISCHARGE)**

*Hot water connections*

**Horizontal discharge**

**Downflow discharge**

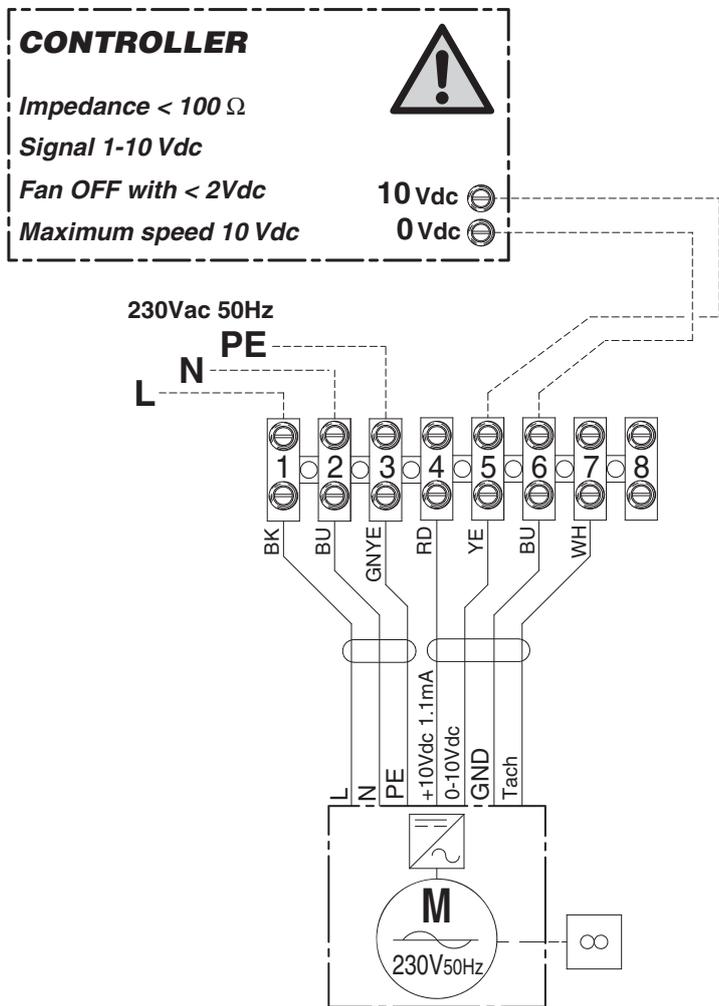

For **Atlas ECM**, the 1-10 Vdc signal, which controls the inverter, must be supplied by a controller with the following signal specifications:

- Impedance < 100 Ω;
- Maximum speed 10Vdc;
- Fan OFF with V < 2Vdc.

DESCRIPTION	IDENTIFICATION	CODE
ADC signal converter for wall controls fitted on the unit	ADCA-M	9008100
ADC signal converter for wall controls supplied with separate packaging	ADC-S	9041072

It is a signal converter that transforms a 230 volt input in 3/10 volt signal. This allows the use of 230V wall controls to control the fan speed for inverter motors. ADC converter is wired between 3 speeds control 230V outputs and the inverter. According to the ADC wiring, the converter will provide different voltage values ranging between 3/10 volt showed in the wiring diagram.

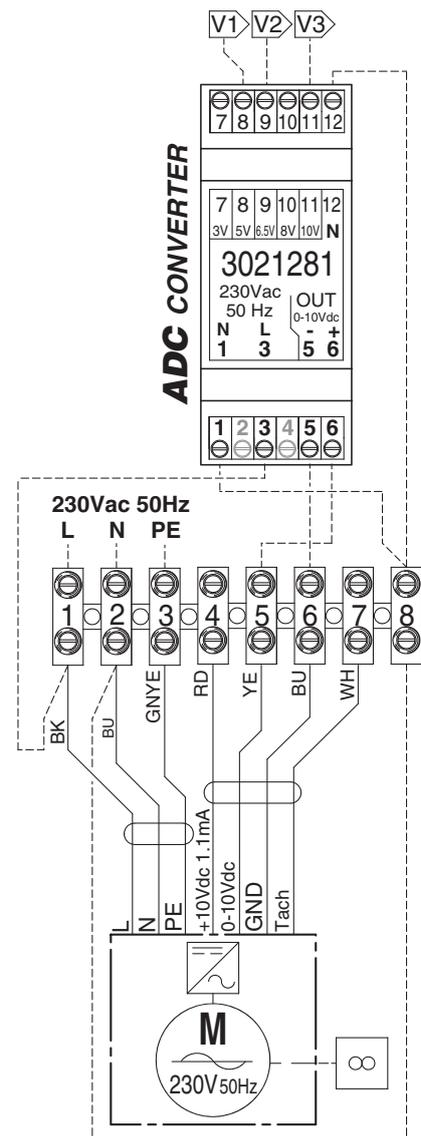

**Electric wiring diagram with ADC converter**

- 7 = 3 Vdc
- 8 = 5 Vdc
- 9 = 6.5 Vdc
- 10 = 8 Vdc
- 11 = 10 Vdc

**ADC CONVERTER**  
input signal  
related to output voltage

IDENTIFICATION	CODE
MO-3V	9060160

- Manual 3 speed switch.
- Without thermostatic control.
- To be used with ADC converter only.

Dimensions: 133x93x37 mm

IDENTIFICATION	CODE
CR-T	9066330

- ON-OFF switch.
- Manual 3 speed switch.
- Manual Summer/Winter switch.
- Electronic room thermostat for fan control (ON-OFF).
- To be used with ADC converter only.

Dimensions: 133x93x37 mm

The minimum required configuration consists of:

- an **EC Base Control** to be used with max 8 units;
- a **4-20 mA / 0-10V signal converter** for every unit;
- a **Potentiometer to control the speed of the motor** or an **NTC Probe with a box** for every EC Base Control.

DESCRIPTION	IDENTIFICATION	CODE
EC Base Control	UH-ECM	9008121

The EC Base Control adjusts the speed of ECM motors with a 4-20 mA output control modulated on the base of the set parameters. The converter located on the unit, or on the first unit if there are several units connected in series, must be connected to these terminals. The EC Base Control can control up to 8 ECM units simultaneously. The fixing brackets are included in the packaging.

Moreover, the EC Base Control has the following features:

- a relay output to control a valve or an alarm signal (for instance a broken probe);
- a digital input for remote ON/OFF control;
- a digital input to reduce the SET POINT value (temperature reduction);
- a digital input for an antifreeze thermostat if required.

On the EC Base Control board there are 5 trimmers used to:

- limit the max operating speed;
- limit the min operating speed;
- set the SET POINT value;
- set the SET POINT ADJ value end;
- set the proportional band with the NTC probe.

DESCRIPTION	IDENTIFICATION	CODE
4-20 mA / 0-10V signal converter	UH-ECM-CNV	9008132

There must be a 4-20 mA / 0-10V signal converter for every unit that needs to be controlled. The signal converter turns the 4-20 mA signal generated by the EC Base Control into a 0-10V signal that operates on the motor's Inverter board. Every converter must be placed inside the motor's junction box. Several units connected in series to one EC Base Control will all operate in the same way (they cannot be controlled individually); to manage several units in a different way, there must be more EC Base Controls.

DESCRIPTION	IDENTIFICATION	CODE
Potentiometer to control the speed of the motor	UH-ECM-RLP	9008133

The potentiometer must be connected to the EC Base Control to modulate the speed of the motor based on the input signal of the potentiometer.

DESCRIPTION	IDENTIFICATION	CODE
NTC probe with box	UH-ECM-NTC	9008141

When it is delivered, the NTC Probe is mounted inside an air-tight plastic box. The NTC Probe must be connected to the EC Base control and detects the ambient temperature. The ambient temperature can be kept within the set limits by setting the set point value on the EC Base Control and adjusting the PB proportional band on the EC Base Control.
